CS 70 Spring 2024

Discrete Mathematics and Probability Theory Seshia, Sinclair

HW 05

1

Due: Saturday, 2/24, 4:00 PM Grace period until Saturday, 2/24, 6:00 PM

Sundry

Before you start writing your final homework submission, state briefly how you worked on it. Who else did you work with? List names and email addresses. (In case of homework party, you can just describe the group.)

1 Equivalent Polynomials

Note 7 Note 8 This problem is about polynomials with coefficients in GF(p) for some prime $p \in \mathbb{N}$. We say that two such polynomials f and g are *equivalent* if $f(x) \equiv g(x) \pmod{p}$ for every $x \in GF(p)$.

- (a) Show that $f(x) = x^{p-1}$ and g(x) = 1 are **not** equivalent polynomials under GF(p).
- (b) Use Fermat's Little Theorem to find a polynomial with degree strictly less than 5 that is equivalent to $f(x) = x^5$ over GF(5); then find a polynomial with degree strictly less than 11 that is equivalent to $g(x) = 4x^{70} + 9x^{11} + 3$ over GF(11).
- (c) In GF(p), prove that whenever f(x) has degree $\geq p$, it is equivalent to some polynomial $\tilde{f}(x)$ with degree < p.

2 Secret Sharing

Note 8

Suppose the Oral Exam questions are created by 2 TAs and 3 Readers. The answers are all encrypted, and we know that:

- Two TAs together should be able to access the answers
- Three Readers together should be able to access the answers
- One TA and one Reader together should also be able to access the answers
- One TA by themself or two Readers by themselves should not be able to access the answers.

Design a Secret Sharing scheme to make this work.

CS 70, Spring 2024, HW 05

3 One Point Interpolation

Note 8

Suppose we have a polynomial $f(x) = x^{k} + c_{k-1}x^{k-1} + \dots + c_{2}x^{2} + c_{1}x + c_{0}$.

- (a) Can we determine f(x) with k points? If so, provide a set of inputs $x_0, x_1, \ldots, x_{k-1}$ such that knowing points $(x_0, f(x_0)), (x_1, f(x_1)), \ldots, (x_{k-1}, f(x_{k-1}))$ allows us to uniquely determine f(x), and show how f(x) can be determined from such points. If not, provide a proof of why this is not possible.
- (b) Now, assume each coefficient is an integer satisfying $0 \le c_i < 100 \quad \forall i \in [0, k-1]$. Can we determine f(x) with one point? If so, provide an input x_* such that knowing the point $(x_*, f(x_*))$ allows us to uniquely determine f(x), and show how f(x) can be determined from this point. If not, provide a proof of why this is not possible.

4 Error-Correcting Codes

Note 9

- (a) Recall from class the error-correcting code for erasure errors, which protects against up to k lost packets by sending a total of n+k packets (where n is the number of packets in the original message). Often the number of packets lost is not some fixed number k, but rather a *fraction* of the number of packets sent. Suppose we wish to protect against a fraction α of lost packets (where $0 < \alpha < 1$). At least how many packets do we need to send (as a function of n and α)?
- (b) Repeat part (a) for the case of general errors.
- 5 Alice and Bob

Note 8 Note 9 (a) Alice decides that instead of encoding her message as the values of a polynomial, she will encode her message as the coefficients of a degree 2 polynomial P(x). For her message $[m_1, m_2, m_3]$, she creates the polynomial $P(x) = m_1 x^2 + m_2 x + m_3$ and sends the five packets (0, P(0)), (1, P(1)), (2, P(2)), (3, P(3)), and (4, P(4)) to Bob. However, one of the packet y-values (one of the P(i) terms; the second attribute in the pair) is changed by Eve before it reaches Bob. If Bob receives

and knows Alice's encoding scheme and that Eve changed one of the packets, can he recover the original message? If so, find it as well as the *x*-value of the packet that Eve changed. If he can't, explain why. Work in mod 7. Also, feel free to use a calculator or online systems of equations solver, but make sure it can work under mod 7.

(b) Bob gets tired of decoding degree 2 polynomials. He convinces Alice to encode her messages on a degree 1 polynomial. Alice, just to be safe, continues to send 5 points on her polynomial even though it is only degree 1. She makes sure to choose her message so that it can be encoded on a degree 1 polynomial. However, Eve changes two of the packets. Bob receives

- (0,5), (1,7), (2,x), (3,5), (4,0). If Alice sent (0,5), (1,7), (2,9), (3,-2), (4,0), for what values of x will Bob not uniquely be able to determine Alice's message? Assume that Bob knows Eve changed two packets. Work in mod 13. Again, feel free to use a calculator or graphing calculator software.
- (c) Alice wants to send a length *n* message to Bob. There are two communication channels available to her: Channel X and Channel Y. Only 6 packets can be sent through channel X. Similarly, Channel Y will only deliver 6 packets, but it will also corrupt (change the value) of one of the delivered packets. Using each of the two channels once, what is the largest message length *n* such that Bob so that he can always reconstruct the message?
