1  GCD Proof

Let $n, x$ be positive integers. Prove that $x$ has a multiplicative inverse modulo $n$ if and only if $\gcd(n, x) = 1$.
(Hint: Remember an iff needs to be proven both directions. The gcd cannot be 0 or negative.)

2  Extended Euclid

In this problem we will consider the extended Euclid’s algorithm. The bolded numbers below keep track of which numbers appeared as inputs to the gcd call. Remember that we are interested in writing the GCD as a linear combination of the original inputs, so we don’t want to accidentally simplify the expressions and eliminate the inputs.

(a) Note that $x \mod y$, by definition, is always $x$ minus a multiple of $y$. So, in the execution of Euclid’s algorithm, each newly introduced value can always be expressed as a "combination" of the previous two, like so:

\[
\begin{align*}
gcd(54, 17) &= gcd(17, 3) = 1 \\
gcd(17, 3) &= gcd(3, 2) = 2 \\
gcd(3, 2) &= gcd(2, 1) = 1 \\
gcd(2, 1) &= gcd(1, 0) = 1
\end{align*}
\]

(Fill in the blanks)

(b) Recall that our goal is to fill out the blanks in

\[
1 = \ldots \times 54 + \ldots \times 17.
\]

To do so, we work back up from the bottom, and express the gcd above as a combination of the two
arguments on each of the previous lines:

\[ 1 = \_\_\_ \times 3 + \_\_\_ \times 2 \]
\[ = \]
\[ = \_\_\_ \times 17 + \_\_\_ \times 3 \]
\[ = \]
\[ = \_\_\_ \times 54 + \_\_\_ \times 17 \]

(c) In the same way as just illustrated in the previous two parts, calculate the \( \text{gcd} \) of 17 and 39, and determine how to express this as a "combination" of 17 and 39.

(d) What does this imply, in this case, about the multiplicative inverse of 17, in arithmetic mod 39?

3 Chinese Remainder Theorem Practice

In this question, you will solve for a natural number \( x \) such that,

\[
\begin{align*}
    x &\equiv 2 \pmod{3} \\
    x &\equiv 3 \pmod{5} \\
    x &\equiv 4 \pmod{7}
\end{align*}
\]  

(1)

(a) Suppose you find 3 natural numbers \( a, b, c \) that satisfy the following properties:

\[
\begin{align*}
    a &\equiv 2 \pmod{3} ; a \equiv 0 \pmod{5} ; a \equiv 0 \pmod{7}, \\
    b &\equiv 0 \pmod{3} ; b \equiv 3 \pmod{5} ; b \equiv 0 \pmod{7}, \\
    c &\equiv 0 \pmod{3} ; c \equiv 0 \pmod{5} ; c \equiv 4 \pmod{7}.
\end{align*}
\]  

(2)  

(3)  

(4)
Show how you can use the knowledge of $a$, $b$ and $c$ to compute an $x$ that satisfies (1).

In the following parts, you will compute natural numbers $a, b$ and $c$ that satisfy the above 3 conditions and use them to find an $x$ that indeed satisfies (1).

(b) Find a natural number $a$ that satisfies (2). In particular, an $a$ such that $a \equiv 2 \pmod{3}$ and is a multiple of 5 and 7. It may help to approach the following problem first:

(b.i) Find $a^*$, the multiplicative inverse of $5 \times 7$ modulo 3. What do you see when you compute $(5 \times 7) \times a^*$ modulo 3, 5 and 7? What can you then say about $(5 \times 7) \times (2 \times a^*)$?

(c) Find a natural number $b$ that satisfies (3). In other words: $b \equiv 3 \pmod{5}$ and is a multiple of 3 and 7.

(d) Find a natural number $c$ that satisfies (4). That is, $c$ is a multiple of 3 and 5 and $c \equiv 4 \pmod{7}$. 
(e) Putting together your answers for Part (a), (b), (c) and (d), report an \( x \) that indeed satisfies (1).
