Today.
Quick review.
Finish Graphs (mostly)

A Tree, a tree.

Graph \( G = (V, E) \).
Binary Tree!
More generally.

Trees.
Definitions:
A connected graph without a cycle.
A connected graph with \(|V|−1\) edges.
A connected graph where any edge removal disconnects it.
A connected graph where any edge addition creates a cycle.

Some trees.
no cycle and connected? Yes.
\(|V|−1\) edges and connected? Yes.
removing any edge disconnects it. Harder to check. but yes.
Adding any edge creates cycle. Harder to check. but yes.
To tree or not to tree!

Equivalence of Definitions.

Theorem:
“\( G \) connected and has \(|V|−1\) edges” \( \iff \) “\( G \) is connected and has no cycles.”

Proof of only if.
Thm:
“\( G \) connected and has \(|V|−1\) edges” \( \implies \) “\( G \) is connected and has no cycles.”

Proof of if
Thm:
“\( G \) is connected and has no cycles” \( \implies \) “\( G \) connected and has \(|V|−1\) edges”

Proof of only if.
Thm:
“\( G \) connected and has \(|V|−1\) edges” \( \implies \) “\( G \) is connected and has no cycles.”

Proof of if
Thm:
“\( G \) is connected and has no cycles” \( \implies \) “\( G \) connected and has \(|V|−1\) edges”
Let $G$ be a connected graph with $|V| - 1$ edges.

(A) Removing a degree 1 vertex can disconnect the graph.
(B) One can use induction on smaller objects.
(C) The average degree is $2 - 2/|V|$.
(D) There is a hotel california: a degree 1 vertex.
(E) Everyone can be bigger than average.

(B), (C), (D) are true.

Proof of “handshake” lemma.

Lemma: The sum of degrees is $2|E|$, for a graph $G = (V, E)$.

What’s true?

(A) The number of edge-vertex incidences for an edge $e$ is 2.
(B) The total number of edge-vertex incidences is $|V|$.
(C) The total number of edge-vertex incidences is $2|E|$.
(D) The number of edge-vertex incidences for a vertex $v$ is its degree.
(E) The sum of degrees is $2|E|$.
(F) Total number of edge-vertex incidences is sum of vertex degrees.
(B) is false. The others are statements in the proof.

Handshake lemma: sum of number of handshakes of each person is twice the number of handshakes.

Poll: Oh tree, beautiful tree.

Lecture Summary.

Graphs.
Basics.
Degree, Incidence. Sum of degrees is $2|E|$. Connectivity.
Connected Component.
maximal set of vertices that are connected.
Algorithm for Eulerian Tour.
Take a walk until stuck to form tour.
Remove tour.
Recurse on connected components.
Trees: degree 1 lemma $\Rightarrow$ equivalence of several definitions.
$G$: $n$ vertices and $n - 1$ edges and connected.
remove degree 1 vertex.
$n - 1$ vertices, $n - 2$ edges and connected $\Rightarrow$ acyclic.
(Ind. Hyp.)
degree 1 vertex is not in a cycle.
$G$ is acyclic.

Poll: Euler concepts.

A graph is Eulerian if it is connected and has even degree.
A graph is Eulerian if it is connected and has a tour that uses every edge once.

Mark correct statements for a connected graph where all vertices have even degree. (Here a tour means uses an edge exactly once, but may involve a vertex several times.

(A) There is no Hotel California in this graph.
(B) Walking on unused edges, starting at $v$, eventually “stuck” at $v$.
(C) Removing a tour leaves a graph of even degree.
(D) Removing a tour leaves a connected graph.
(E) Remove set of edges $E'$ in connected graph, connected component is incident to edge in $E'$
(F) A tour connecting a set of connected components, each with a Eulerian tour is really cool! This implies the graph is Eulerian.

Only (D) is false. The rest are steps in the proof.

Poll: Oh tree, beautiful tree.

Lecture 6.

Euler’s Formula.
Planar Six and then Five Color theorem.
Types of graphs.
Complete Graphs.
Trees (a little more.)
Hypercubes.
Planar graphs.

A graph that can be drawn in the plane without edge crossings.

Planar? Yes for Triangle. Four node complete? Yes. (complete = every edge present, \( K_n \) is \( n \)-vertex complete graph.) Five nodes complete or \( K_5 \) ? No! Why? Later.

Two to three nodes, bipartite? Yes. Three to three nodes, complete/bipartite or \( K_{3,3} \). No. Why? Later.

Euler’s Formula.

Faces: connected regions of the plane.

How many faces for triangle? 2 complete on four vertices or \( K_4 \)? 4 bipartite, complete two/three or \( K_{3,3} \)? 3

\( v \) is number of vertices, \( e \) is number of edges, \( f \) is number of faces.

Euler’s Formula: Connected planar graph has \( v + f = e + 2 \).

Triangle: \( 3 + 2 = 3 + 2 \)

\( K_4: 4 + 4 = 6 + 2! \)

\( K_{3,3}: 5 + 3 = 6 + 2! \)

Examples = 3! Proven! Not!!!!

Planar \( \Rightarrow \) \( e \leq 3v - 6 \). Flow Poll.

Euler’s formula: \( v + f = e + 2 \)

Consider graph with > 2 vertices. Understand the following.

(A) Every face is incident to > 3 edges.
(B) If face-edge incidences \( > 3 \)
(C) Every edge is incident (with multiplicity) to 2 faces.
(D) \( \parallel \text{Face-edge incidences} \parallel = 2e \)
(E) \( 3f \leq \parallel \text{Face-edge-incidences} \parallel = 2e \)
(F) \( 3(e + 2 − v) \leq 2e \)

Conclusion: \( e \leq 3v - 6 \)

Euler and non-planarity of \( K_5 \) and \( K_{3,3} \)

Euler: \( v + f = e + 2 \) for connected planar graph.

Consider simple graphs where \( v \geq 3 \).

Consider Face edge Adjacencies with multiplicities

\( \Rightarrow 3f \leq 2e \) for any planar graph with \( v > 2 \).

Or \( f \leq \frac{2}{3} e \).

Plug into Euler: \( v + \frac{2}{3} e \geq e + 2 \) \( \Rightarrow e \leq 3v - 6 \)

\( K_5 \) Edges? \( e = 4 + 3 + 2 + 1 + 10 \). Vertices? \( v = 5 \).

\( 10 \leq 3(5) − 6 = 9 \). \( \Rightarrow K_5 \) is not planar.

Euler and Polyhedron.

Greeks knew formula for polyhedron.

Euler: Connected planar graph: \( v + f = e + 2 \).

\( 8 + 6 = 12 + 2 \).

For Convex Polyhedron:

Surround by sphere.

Project Sphere-N onto Plane: drawing on plane.

Euler proved formula thousands of years later!

Proving non-planarity for \( K_{3,3} \)

\( K_{3,3} \) Edges? 9. Vertices. 6.

\( e \leq 3(v) − 6 \) for planar graphs.

\( 9 \leq 3(6) − 6 = 9 \). Sure!

Step in proof of \( K_{3,3} \): faces are adjacent to \( \geq 3 \) edges.

For \( K_{3,3} \) every cycle is of even length or incident \( \geq 4 \) faces.

Finish in homework!
Planarity and Euler

These graphs cannot be drawn in the plane without edge crossings.

Euler's Formula: \( v + f = e + 2 \) for any planar drawing.

\[ \implies \text{for simple planar graphs: } e \leq 3v - 6. \]

Idea: Face is a cycle in graph of length 3.

Count face-edge incidences.

\[ \implies \text{for bipartite simple planar graphs: } e \leq 2v - 4. \]

Idea: face is a cycle in graph of length 4.

Count face-edge incidences.

Proved absolutely no drawing can work for these graphs.

So....so ...Cool!

---

Euler's formula.

Euler: Connected planar graph has \( v + f = e + 2 \).

Steps/concepts in proof of euler's formula:

(A) Planar drawing of tree has 1 face.
(B) Tree has \(|V| - 1 \) edges.
(C) Induction.
(D) face is adjacent to at least 3 edges.
(E) edge has two edge-vertex incidences.
(F) Add edge to planar drawing splits a face.

All are true and all are relevant to the proof, though (E) is more analogous than direct.

---

Graph Coloring.

Given \( G = (V,E) \), a coloring of \( G \) assigns colors to vertices \( V \) where for each edge the endpoints have different colors.

Notice that the last one, has one three colors.

Fewer colors than number of vertices.

Fewer colors than max degree node.

Interesting things to do. Algorithm!

---

Six color theorem.

Theorem: Every planar graph can be colored with six colors.

Proof:

Recall: \( e \leq 3v - 6 \) for any planar graph where \( v > 2 \).

From Euler's Formula.

Total degree: \( 2e \)

Average degree: \[ \frac{2e}{v} \leq \frac{2(3v-6)}{v} \leq 6 - \frac{12}{v}. \]

There exists a vertex with degree \(< 6 \) or at most 5.

Remove vertex \( v \) of degree at most 5.

Inductively color remaining graph.

Color is available for \( v \) since only five neighbors.... and only five colors are used.
**Five color theorem: preliminary.**

Preliminary Observation: Connected components of vertices with two colors in a legal coloring can switch colors.

Look at only green and blue. Connected components. Can switch in one component. Or the other.

**Five color theorem**

Theorem: Every planar graph can be colored with five colors.

Preliminary Observation: Connected components of vertices with two colors in a legal coloring can switch colors.

**Proof:** Again with the degree 5 vertex. Again recurse.

Assume neighbors are colored all differently. Otherwise one of 5 colors is available. Done! Switch green and blue in green’s component. Done. Unless blue-green path to blue. Switch orange and red in oranges component. Done. Unless red-orange path to red. Planar. paths intersect at a vertex! What color is it? Must be blue or green to be on that path. Must be red or orange to be on that path. Contradiction. Can recolor one of the neighbors. Gives an available color for center vertex!

**Four Color Theorem**

Theorem: Any planar graph can be colored with four colors.

**Proof:** Not Today!

**Complete Graph.**

$K_n$ complete graph on $n$ vertices. All edges are present. Everyone is my neighbor. Each vertex is adjacent to every other vertex.

How many edges?

Each vertex is incident to $n-1$ edges. Sum of degrees is $n(n-1) = 2|E|$. Number of edges is $n(n-1)/2$.

**5 color theorem. Flow poll.**

Steps/ideas in 5-color theorem.

(A) There is a degree 5 vertex cuz Euler.
(B) Take subgraph of first and third colors, recolor first components.
(C) If a third’s component is different, switched coloring is good.
(D) Subgraph of second and fourth colors, can recolor, recolor second component.
(G) At least one separate component cuz planarity.
(F) Shared color of five neighbors, done.

All steps in proof!

**K4 and K5**

$K_5$ is not planar. Cannot be drawn in the plane without an edge crossing! Prove it! We did!
Hypercubes.

Complete graphs, really connected! But lots of edges.

$|V||V| - 1)/2$

Trees, few edges, $(|V| - 1)$

but just falls apart!

Hypercubes. Really connected.

$V\log V / 2$

Trees, few edges. $(|V| - 1)$

but just falls apart!

Hypercubes.

Recursive Definition.

A 0-dimensional hypercube is a node labelled with the empty string of bits.

$G = (V, E)$

$|V| = \{0, 1\}^n$, $|E| = \{(x, y)|x$ and $y$ differ in one bit position.$\}$

Cuts in graphs.

S is red, $V - S$ is blue.

What is size of cut?

Number of edges between red and blue. 4.

Hypercube: any cut that cuts off $x$ nodes has $\geq x$ edges.

Proof of Large Cuts.

Thm: For any cut ($S, V - S$) in the hypercube, the number of cut edges is at least the size of the small side.

Proof:

Base Case: $n = 1 V = \{0, 1\}$.

$S = \{0\}$ has one edge leaving. $|S| = \phi$ has 0.

Induction Step Idea

Thm: For any cut ($S, V - S$) in the hypercube, the number of cut edges is at least the size of the small side.

Use recursive definition into two subcubes.

Two cubes connected by edges.

Case 1: Count edges inside subcube inductively.

Case 2: Count inside and across.
Induction Step

Thm: For any cut \((S, V - S)\) in the hypercube, the number of cut edges is at least the size of the small side, \(|S|\).

Proof: Induction Step.

Recursive definition:

\(H_0 = (V_0, E_0)\), \(H_1 = (V_1, E_1)\), where \(V_0\) and \(V_1\) are first and second, and \(S_t\) in other.

Case 1: \(|S_0| \leq \frac{|V_0|}{2}\), \(|S_1| \leq \frac{|V_1|}{2}\)

Both \(S_0\) and \(S_1\) are small sides. So by induction.

Edges cut in \(H_0\) \(\geq |S_0|\).

Edges cut in \(H_1\) \(\geq |S_1|\).

Total cut edges \(\geq |S_0| + |S_1| = |S|\).

Case 2.

Thm: For any cut \((S, V - S)\) in the hypercube, the number of cut edges is at least the size of the small side, \(|S|\).

\(|S_0| \geq \frac{|V_0|}{2}\).

Recall Case 1: \(|S_0|, |S_1| < |V|/2\)

\(|S_1| \leq |V_1|/2\) since \(|S_0| \leq |V_0|/2\)

\(|S_1| \geq |V_0|/2 \rightarrow |V_0 - S| \leq |V_0|/2\)

\(|S_1| \geq |V_0|/2 \rightarrow |V_0 - S| \leq |V_0|/2\)

Edges in \(E_x\) connect corresponding nodes.

\(\geq |S_0| - |S_1|\) edges cut in \(E_x\).

Total edges cut:

\(\geq |S_0| + |S_1| - |S_1| = |S_0|\).

Also, case 3 where \(|S_1| \geq |V|/2\) is symmetric.

Hypercubes and Boolean Functions.

The cuts in the hypercubes are exactly the transitions from 0 sets to 1 set on boolean functions on \((0, 1)^n\).

Central area of study in computer science!

Yes/No Computer Programs = Boolean function on \(\{0, 1\}^n\)

Central object of study.

Summary.

Euler: \(v + f = e + 2\).

Tree. Plus adding edge adds face.

Planar graphs: \(e \leq 3v = 6\).

Count face-edge incidences to get \(2e \leq 3f\).

Replace \(f\) in Euler.

Coloring:

degree \(d\) vertex can be colored if \(d + 1\) colors.

Small degree vertex in planar graph: 6 color theorem.

Recolor separate and planarity: 5 color theorem.

Graphs:

Trees: sparsest connected.

Complete densest

Hypercube: middle.
